Civil Action No. \_\_\_\_\_

**COMPLAINT**

Plaintiff Gedeon Richter Vegyeszeti Gyar RT ("Gedeon Richter"), for its complaint against the Honorable John J. Doll, states as follows:

**NATURE OF THE ACTION**

1. This is an action by the assignee of United States Patent No. 7,435,744 ("the '744 patent") seeking judgment, pursuant to 35 U.S.C. § 154(b)(4)(A), that the patent term adjustment for the '744 patent be changed from 580 days to 837 days.
2. This action arises under 35 U.S.C. § 154 and the Administrative Procedure Act, 5 U.S.C. §§ 701-706.

**THE PARTIES**

3. Plaintiff Gedeon Richter is a corporation organized under the laws of Hungary, having a principal place of business at Budapest 10, Pf. 27, H-1475, Hungary.

4. Defendant John J. Doll is the Acting Under Secretary of Commerce for Intellectual Property and Acting Director of the United States Patent and Trademark Office (“PTO”), acting in his official capacity. The Director is the head of the PTO and is responsible for superintending or performing all duties required by law with respect to the granting and issuing of patents, and is designated by statute as the official responsible for determining the period of patent term adjustments under 35 U.S.C. § 154.

#### **JURISDICTION AND VENUE**

5. This Court has jurisdiction to hear this action and is authorized to issue the relief sought pursuant to 28 U.S.C. §§ 1331, 1338(a) and 1361, 35 U.S.C. § 154(b)(4)(A) and 5 U.S.C. §§ 701-706.

6. Venue is proper in this district by virtue of 35 U.S.C. § 154(b)(4)(A).

7. This Complaint is being timely filed in accordance with 35 U.S.C. § 154(b)(4)(A).

#### **BACKGROUND**

8. Gyorgy Domány, Csilla Horváth, Gizella Bartáné Szalai, József Nagy, Sándor Kolok, Éva Kovácsné Bozó, István Borza, István Vágó, Attila Bielik, Györgyi Ignáczné Szendrei, György Keserü, and Sándor Farkas are inventors of the patent application number 10/761,940 (“the ‘940 application”) which issued as the ‘744 patent, entitled Piperidine Derivatives as NMDA Receptor Antagonists, on October 14, 2008. The ‘744 patent is attached hereto as Exhibit A.

9. Plaintiff Gedeon Richter is the assignee of the ‘744 patent, as evidenced by records in the PTO, and is the real party in interest in this case.

10. Section 154 of 35 U.S.C. requires that the Director of the PTO grant a patent term adjustment in accordance with the provisions of section 154(b). Specifically, 35 U.S.C. §

154(b)(3)(D) states that “[t]he Director shall proceed to grant the patent after completion of the Director's determination of a patent term adjustment under the procedures established under this subsection, notwithstanding any appeal taken by the applicant of such determination.”

11. In calculating the patent term adjustment, the Director has to take into account PTO delays under 35 U.S.C. § 154(b)(1), any overlapping periods in the PTO delays under 35 U.S.C. § 154(b)(2)(A), and any applicant delays under 35 U.S.C. § 154(b)(2)(C).

12. Under 35 U.S.C. § 154(b)(4)(A), “[a]n applicant dissatisfied with a determination made by the Director under paragraph (3) shall have remedy by a civil action against the Director filed in the United States District Court for the District of Columbia within 180 days after the grant of the patent. Chapter 7 of title 5 shall apply to such action.”

#### **CLAIM FOR RELIEF**

13. The allegations of paragraphs 1-12 are incorporated in this claim for relief as if fully set forth.

14. The patent term adjustment for the ‘744 patent, as determined by the defendant under 35 U.S.C. § 154(b), and listed on the face of the ‘744 patent, is 580 days. (*See* Ex. A at 1). The determination of the 580-day patent term adjustment is in error in that, pursuant to 35 U.S.C. § 154(b)(1)(B), the PTO failed to allow an adjustment for the time exceeding three years after the actual filing date of the ‘940 application to the date when the ‘744 patent issued. The correct patent term adjustment for the ‘744 patent is at least 837 days.

15. The ‘940 application was filed on January 21, 2004, and issued as the ‘744 patent on October 14, 2008.

16. Under 35 U.S.C. § 154(b)(1)(A), the plaintiff is entitled to an adjustment of the term of the '744 patent of a period of 678 days, which is the number of days attributable to PTO examination delay ("A Delay").

17. Under 35 U.S.C. § 154(b)(1)(B), the plaintiff is entitled to an additional adjustment of the term of the '744 patent of a period of 257 days, which is the number of days the issue date of the '744 patent exceeds three years from the filing date of the application, up to the October 5, 2007 filing date of the Request for Continued Examination ("B Delay").

18. Section 35 U.S.C. § 154(b)(2)(A) states that "to the extent . . . periods of delay attributable to grounds specified in paragraph [154(b)(1)] overlap, the period of any adjustment granted under this subsections shall not exceed the actual number of days the issuance of the patent was delayed." For the '744 patent, none of the A Delay overlaps with the B Delay period. Therefore, there is no period of overlap to be excluded for the patent term adjustment.

19. Thus, the total period of PTO delay is 935 days, which is the sum of the period of A Delay (678 days) and the period of B Delay (257 days).

20. Under 35 U.S.C. § 154(b)(2)(C), the total period of PTO delay is reduced by the period of applicant delay, which is 98 days as determined by the PTO.

21. Accordingly, the correct patent term adjustment under 35 U.S.C. § 154(b)(1) and (2) is 837 days, which is the difference between the total period of PTO delay (935 days) and the period of applicant delay (98 days).

22. The defendant's imposition of only 580 days of patent term adjustment for the '744 patent is arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law and in excess of statutory jurisdiction, authority or limitation.

23. The defendant's determination that the period of the patent term adjustment for the '744 patent is only 580 days is in conflict with this Court's decision in *Wyeth v. Dudas*, 580 F.Supp.2d 138, 88 USPQ2d 1538 (D.D.C. 2008), which explains the proper method for calculating patent term adjustments under 35 U.S.C. § 154(b). The *Wyeth v. Dudas* decision is attached as Exhibit B.

WHEREFORE, Plaintiff respectfully prays that this Court:

A. Issue an Order changing the period of patent term adjustment for the '744 patent term from 580 days to 837 days and requiring defendant to alter the term of the '744 patent to reflect the 837-day patent term adjustment; and

B. Grant such other and further relief as the nature of the case may admit or require and as may be just and equitable.

Respectfully submitted,

(57) **ABSTRACT**

The present invention relates to a compound of formula (I):

wherein: V and U are hydrogen, halogen, C<sub>1</sub>-C<sub>4</sub> alkylamino, or together form a group that contains one or more heteroatoms, and that taken together with one or more:

- (a) hydrogen atoms;
- (b) carbon atoms;
- (c) —CH= groups;
- (d) —CH<sub>2</sub>— groups; or
- (e) additional heteroatoms of the same or different type;

or any combination thereof, form a 4-7 membered homocyclic or heterocyclic ring, wherein the homocyclic or heterocyclic ring may combine with the phenyl group to form a bicyclic ring, and wherein the homocyclic or heterocyclic ring or the bicyclic ring may contain one or more oxo, thioxo, amino, mercapto, trifluoromethyl, C<sub>1</sub>-C<sub>4</sub> alkyl, =S or —SH groups;

W: is —CO—, —CH<sub>2</sub>— or —CH<sub>2</sub>—(C<sub>1</sub>-C<sub>4</sub> alkyl);

X: is —CO—;

Y: is —O—, C<sub>1</sub>-C<sub>4</sub> alkylene, C<sub>1</sub>-C<sub>4</sub> alkynylene, cycloalkylene, aminocarbonyl, —NH—, —N(C<sub>1</sub>-C<sub>4</sub> alkyl)—, —C<sub>1</sub>-C<sub>4</sub> alkylene-N(C<sub>1</sub>-C<sub>4</sub> alkyl)—, —CH<sub>2</sub>O—, —CH(OH)— or —OCH<sub>2</sub>—;

Z: is hydrogen, halogen, nitro, amino, C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>4</sub> alkoxy, cyano, trifluoromethyl, hydroxyl or carboxyl;

R<sup>1</sup> and R<sup>2</sup>: are hydrogen, or together form a C<sub>1</sub>-C<sub>3</sub> bridge; and n and m: independently are 0-3, wherein n and m cannot each be 0;

or an optical antipode, racemate or pharmaceutically-acceptable salt thereof. The carboxylic acid amide derivatives of formula (I) are highly effective and selective antagonists of the NMDA receptor.

## PIPERIDINE DERIVATIVES AS NMDA RECEPTOR ANTAGONISTS

This application is a continuation patent application of International application no. PCT/HU02/00071, filed Jul. 23, 2002, which claims priority to Hungarian patent application nos. P 0103055 (filed Jul. 24, 2001) and P 0202213 (filed Jul. 10, 2002). The International application and both Hungarian applications are each hereby incorporated by reference in their entirety.

### FIELD OF THE INVENTION

The present invention relates to carboxylic acid amide derivatives which are antagonists of NMDA receptors, intermediates and processing for preparing the same.

### BACKGROUND OF THE INVENTION

N-methyl-D-aspartate (NMDA) receptors are ligand-gated cation-channels embedded in the cell membranes of neurons. Overactivation of NMDA receptors by glutamate, their natural ligand, can lead to calcium overload of cells. This triggers a cascade of intracellular events that alters the cell function and ultimately may lead to death of neurons [TINS, 10, 299-302 (1987)]. Antagonists of the NMDA receptors may be used for treating many disorders that are accompanied with excess release of glutamate, the main excitatory neurotransmitter in the central nervous system.

The knowledge on the NMDA receptor structure, function and pharmacology has expanded owing to recent achievements of the molecular biology. The NMDA receptors are heteromeric assemblies built up from at least one NR1 subunit and at least one of the four different NR2 subunits (NR2A-D). Both spatial distributions in the CNS and the pharmacological sensitivity of NMDA receptors built up from various NR2 subunits are different. Particularly interesting of these is the NR2B subunit due to its restricted distribution (highest densities in the forebrain and substantia gelatinosa of the spinal cord). Compounds selective for this subtype are available [Curr. Pharm. Des., 5, 381-404 (1999)] and have been proved to be effective in animal models of stroke [Stroke, 28, 2244-2251 (1997)], traumatic brain injury [Brain Res., 792, 291-298 (1998)], Parkinson's disease [Exp. Neurol., 163, 239-243 (2000)], neuropathic and inflammatory pain [Neuropharmacology, 38, 611-623 (1999)]. Moreover, NR2B subtype selective antagonists of NMDA receptors are expected to possess little or no untoward side effects that are typically caused by the non-selective antagonists of NMDA receptors, namely psychotomimetic effects such as dizziness, headache, hallucinations, dysphoria and disturbances of cognitive and motor function.

NR2B subtype selective NMDA antagonism can be achieved with compounds that specifically bind to, and act on, an allosteric modulatory site of the NR2B subunit containing receptors. This binding site can be characterized by displacement (binding) studies with specific radioligands, such as [<sup>125</sup>I]-ifenprodil [J. Neurochem., 61, 120-126 (1993)] or [<sup>3</sup>H]-Ro 25,6981 [J. Neurochem., 70, 2147-2155 (1998)]. Since ifenprodil was the first, though not sufficiently specific, known ligand of this receptor, it has also been termed ifenprodil binding site.

Close structure analogs of the carboxylic acid amide derivatives of formula (I) are known from the literature. The Florida Center for Heterocyclic Compounds [Department of Chemistry, University of Florida, P.O. Box 117200, Gainesville, Fla., 32611-7200] provides milligram quantities of

2

three compounds of formula (I) for biological testing: N-(4-bromophenyl)-4-(phenylmethyl)-1-piperidineacetamide, 4-[[oxo[4-(phenylmethyl)-1-piperidinyl]acetyl]amino]benzoic acid and 4-[[oxo[4-(phenylmethyl)-1-piperidinyl]acetyl]amino]benzoic acid ethyl ester.

Oxo-ethylamino derivatives are described as intermediates for thrombin inhibitors [Bioorg. Med. Chem. Letters, 9, 925. (1999)]. The publication does not describe NMDA receptor antagonist effect.

N-(4-Benzoylphenyl)-4-(phenylmethyl)-1-piperidineacetamide is mentioned in U.S. Pat. No. 6,048,900 as selective neuropeptide Y receptor antagonist.

N-(2-Formyl-6-methylphenyl)-4-(phenylmethyl)-1-piperidineacetamide is described in Australian patent application No. AU 639529 as an intermediate for carbostyryl derivative which is useful as antiarrhythmics.

Aminoacetarilides are also known [Rev. Chim. (Bucharest), 33(7), 601. (1982); CA 97:174467a] as local anesthetic and antifibrillatory agents.

Piperidine derivatives and analogues substituted with phenols or phenol equivalents having NR2B selective NMDA antagonist activity are described in international patent application nos. WO 90/14087, WO 90/14088, WO 97/23202, WO 97/23214, WO 97/23215, WO 97/23216, WO 97/23458, WO 99/21539, WO 00/25109, European patent application No. EP 648744 A1 and in U.S. Pat. No. 5,436,255. Compounds containing 2-benzoxazolinone substructure with the same biological activity are described in international patent applications WO 98/18793 and WO 00/00197. Other NR2B selective NMDA antagonists having condensed heterocyclic structures are described in international patent application nos. WO 01/30330, WO 01/32171, WO 01/32174, WO 01/32177, WO 01/32179, 01/32615, WO 01/32634.

However, there continues to be a need for novel NMDA antagonists that target the NR2B receptor.

### SUMMARY OF THE INVENTION

Carboxylic acid amide derivatives of formula (I)

are functional antagonists of NMDA receptors, which target the NMDA receptors primarily via binding to the ifenprodil binding site and are, thus, believed to be NR2B subtype specific antagonists.

### DETAILED DESCRIPTION OF THE INVENTION

The present invention relates therefore first to carboxylic acid amide derivatives of formula (I):

wherein

V and U are hydrogen or halogen atom, hydroxyl, cyano, nitro, amino, C<sub>1</sub>-C<sub>4</sub> alkylamino optionally substituted by a halogen atom or halogen atoms, arylamino optionally substituted by a halogen atom or halogen atoms, aralkylamino optionally substituted by a halogen atom or halogen atoms, C<sub>1</sub>-C<sub>4</sub> alkylsulfonamido optionally substituted by a halogen atom or halogen atoms, C<sub>1</sub>-C<sub>4</sub> alkanoylamido optionally substituted by a halogen atom or halogen atoms, arylsulfonamido, C<sub>1</sub>-C<sub>4</sub> alkylsulfonyloxy, carboxyl, trifluoromethyl, trifluoromethoxy, C<sub>1</sub>-C<sub>4</sub> alkyl-SO<sub>2</sub>-NH-CH<sub>2</sub>-, NH<sub>2</sub>-(CH<sub>2</sub>)<sub>1-4</sub>-SO<sub>2</sub>-NH-, NH<sub>2</sub>-(CH<sub>2</sub>)<sub>1-4</sub>-(CO)-NH-, sulfamoyl [NH<sub>2</sub>-SO<sub>2</sub>-], formyl [-CHO], amino-methyl [-CH<sub>2</sub>-NH<sub>2</sub>], hydroxymethyl, C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>4</sub> alkoxyethyl, halogenmethyl, tetrazolyl group, or C<sub>1</sub>-C<sub>4</sub> alkoxy, C<sub>1</sub>-C<sub>4</sub> alkoxy-carbonyl, C<sub>1</sub>-C<sub>6</sub> alkanoyloxy, phenyl or C<sub>1</sub>-C<sub>4</sub> alkoxy groups, optionally substituted by amino group, or

the neighboring V and U groups in given case together with one or more identical or different additional hetero atom and -CH= and/or -CH<sub>2</sub>- groups can form an optionally substituted 4-7 membered homo- or heterocyclic ring, preferably morpholine, pyrrole, pyrrolidine, oxo- or thioxo-pyrrolidine, pyrazole, pyrazolidine, imidazole, imidazolidine, oxo- or thioxo-imidazole or imidazolidine, 1,4-oxazine, oxazole, oxazolidine, oxo- or thioxo-oxazolidine, or 3-oxo-1,4-oxazine ring,

W and X independently are -CO-, -CH<sub>2</sub>- or -CH(-alkyl)- groups, wherein alkyl is a C<sub>1</sub>-C<sub>4</sub> alkyl group groups—with the restriction, that the meaning of W and X can not be methylene at the same time

Y is oxygen, as well as C<sub>1</sub>-C<sub>4</sub> alkylene, C<sub>1</sub>-C<sub>4</sub> alkynylene, cycloalkylene, aminocarbonyl, -NH-, -N(alkyl)-, -CH<sub>2</sub>O-, -CH(OH)-, -OCH<sub>2</sub>- group, wherein alkyl is a C<sub>1</sub>-C<sub>4</sub> alkyl-

Z is hydrogen or halogen, nitro, amino, C<sub>1</sub>-C<sub>4</sub> alkyl, C<sub>1</sub>-C<sub>4</sub> alkoxy, cyano, trifluoromethyl, hydroxyl or carboxy,

R<sup>1</sup> and R<sup>2</sup> independently are hydrogen atom or alkyl, or R<sup>1</sup> and R<sup>2</sup> together form an optionally substituted C<sub>1</sub>-C<sub>3</sub> bridge and

n and m independently are 0-3, with the restriction, that n and m can not be 0 at the same time, and optical antipodes or racemates and/or pharmaceutically acceptable salts thereof formed with acids and bases with the proviso that when Z is hydrogen, Y is -CH<sub>2</sub>-, both of m and n are 2, both of R<sup>1</sup> and R<sup>2</sup> are hydrogen atom, W is -CO-, X is -CH<sub>2</sub>- and V is hydrogen, then the meaning of U is other than a 4-bromo substituent and when Z is hydrogen, Y is -CH<sub>2</sub>- group, both of m and n are 2, both of R<sup>1</sup> and R<sup>2</sup> are hydrogen atom, both of W and X are -CO- group and V is hydrogen atom, then the meaning of U is other than a 4-carboxyl or 4-etoxy-carbonyl substituent.

Further objects of the present invention are the pharmaceutical compositions containing carboxylic acid amide compounds of formula (I) or optical antipodes or racemates or the salts thereof as active ingredients.

A further object of the invention are the processes for producing of carboxylic acid amide compounds of formula (I), and the pharmaceutical manufacture of medicaments containing these compounds, as well as the process of treatments with these compounds, which means administering to a mammal to be treated—including human—effective amount/amounts of compounds of formula (I) of the present invention or as a medicament.

The carboxylic acid amide derivatives of formula (I) of the present invention are highly effective and selective antago-

4

nists of NMDA receptor, and moreover most of the compounds are selective antagonist of NR2B subtype of NMDA receptor.

According to the invention the carboxylic acid amide compounds of formula (I) can be prepared by the following processes:

a) for producing of compounds of formula (I) wherein X is -CO- and R<sup>1</sup>, R<sup>2</sup>, Y, Z, U, V, W, n and m are as given above for the formula of (I), a carboxylic acid of formula (II)

the obtained substituted glycine of formula (XI)

where  $R^1$ ,  $R^2$ ,  $m$ ,  $n$ ,  $Y$  and  $Z$  have the same meaning as given for formula (I) is reacted with an amide of formula (V)

wherein  $U$  and  $V$  are as given before for the formula of (I), in dichloromethane/dimethylformamide mixture in presence of 1-[3-(dimethylamino)-propyl]-3-ethylcarbodiimide, and the obtained compounds of formula (I), where  $R^1$ ,  $R^2$ ,  $Y$ ,  $Z$ ,  $U$ ,  $V$ ,  $X$ ,  $W$ ,  $n$  and  $m$  are as defined above, in given case are transformed into another compound of formula (I) by introducing further substituents and/or modifying and/or removing the existing ones, and/or formation of salts with acids and/or liberating the carboxylic acid amide derivative of formula (I) from the obtained acid addition salts by treatment with a base and/or the free carboxylic acid amide derivative of formula (I) can be transformed into a salt by treatment with a base and/or are resolved into their optical antipodes.

The amide bond formation is preferably carried out by preparing an active derivative from a carboxylic acid of formula (II) or (IV) which is reacted with an amine of formula (III) or (V) preferably in the presence of a base.

The transformation of a carboxylic acid into an active derivative can be carried out in situ during the amide bond formation in a proper solvent (for example dimethylformamide, acetonitrile, chlorinated hydrocarbons or hydrocarbons). The active derivatives can be acid chlorides (for example prepared from carboxylic acid with thionyl chloride), mixed anhydrides (for example prepared from carboxylic acid with isobutyl chloroformate in the presence of a base, e.g., triethylamine), active esters (for example prepared from carboxylic acid with hydroxybenzotriazol and dicyclohexylcarbodiimide or O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (HBTU) in the presence of a base, e.g., triethylamine), acid azides (for example prepared from carboxylic acid hydrazide). The active derivatives can be prepared between room temperature and  $0^\circ\text{C}$ . A proper amine of formula (III) or (V) is added as base or as a salt formed with inorganic acid to the so obtained solution or suspension in the presence of a base, for example triethylamine, needed for the liberation of the amine. The condensation reactions are followed by thin layer chromatography. The necessary reaction time is 6-20 hours. The work-up of the reaction mixture can be carried out by different methods.

The amide bond formation is preferably carried out by refluxing in a proper solvent an amine of formula (III) or (V) with a halogen compound of formula (IV) or (VII) in the presence of an organic base (e.g., triethylamine, pyridine, piperidine) or an inorganic base (e.g., sodium carbonate or potassium carbonate) and sodium iodide. The proper solvent can be an aprotic solvent (e.g., toluene, chlorinated hydrocarbons) or a dipolar aprotic solvent (e.g., ketone, acetonitrile or

8

dimethylformamide). The reactions are followed by thin layer chromatography. The necessary reaction time is 20-50 hours. The work-up of the reaction mixture also can be carried out by different methods.

When the reaction mixture is a suspension, the precipitate is filtered off, washed with water and/or with an organic solvent and recrystallized from a proper solvent to give the pure product. If the crystallization does not lead to the pure product, then column chromatography can be used for the purification of it. The column chromatography is carried out on normal phase using Kieselgel 60 as adsorbent and different solvent systems, e.g., toluene/methanol, chloroform/methanol or toluene/acetone, as eluents. If the reaction mixture is a solution at the end of the acylation or alkylation, it is concentrated, and the residue is crystallized or purified by column chromatography as described above. The structure of the products are determined by IR, NMR and mass spectrometry.

The obtained carboxylic acid amide derivatives of formula (I)—independently from the method of preparation—in given case can be transformed into another compound of formula (I) by introducing further substituents and/or modifying and/or removing the existing ones, and/or formation of salts with acids and/or liberating the carboxylic acid amide derivative of formula (I) from the obtained acid addition salts by treatment with a base and/or the free carboxylic acid amide derivative of formula (I) can be transformed into a salt by treatment with a base.

For example cleaving the methyl and benzyl groups from methoxy and benzyloxy groups, which stands for  $U$ ,  $V$  and  $Z$ , leads to phenol derivatives. The removal of the benzyl group can be carried out for example with catalytic hydrogenation or with hydrogen bromide in acetic acid solution, the cleavage of methyl group can be carried out with boron tribromide in dichloromethane solution. The compounds of formula (I) containing free phenolic hydroxy group can be transformed into acyloxy or sulfoxy derivatives with different acylating or sulfonylating agents. The reactions are carried out at room temperature in chlorinated hydrocarbons using acid chloride or acid anhydride as acylating agent in the presence of a base (e.g., triethylamine or sodium carbonate). The carboxylic acid amide derivatives of formula (I) containing a nitro group (I) can be transformed into amines by catalytic hydrogenation and the amines can be further reacted to give acid amides as described for the acylation of phenolic hydroxy groups. Free hydroxy groups can be esterified by acid anhydrides or acid halogenides in the presence of a base.

The carboxylic acids of formula (II) or (IV), the primary or secondary amines of formula (III) or (V) and the halogen compounds of formula (VI) or (VII) are either commercially available or can be synthesized by different known methods. The syntheses of some commercially not available carboxylic acids of formula (II) or (IV) or halogen compounds of (VI) or (VII) are described in the Examples. Following these procedures the other commercially not available carboxylic acids of formula (II) or (IV) or halogen compounds of formula (VI) or (VII) can also be prepared.

## EXPERIMENTAL PROTOCOLS

#### Assessing the Functional NMDA Antagonist Potency of Compounds in Primary Cultures of Rat Cortical Neurons Based on Measuring the Intracellular Calcium Concentration Using a Fluorimeter Plate Reader

It is known that during postnatal development the subunit composition of neuronal NMDA receptors is changing. Simi-

US 7,435,744 B2

9

lar change has been detected in neuronal cell cultures [Eur. J. Neurosci., 10, 1704-1715 (1998)]. According to data in the literature and to our own immunocytochemical examinations neuronal cells cultured for 4-7 days in vitro predominantly express the NR2B subunit, together with NR1 subunit. Therefore, functional test of NMDA antagonism in these cells reflects mainly an action on NR2B subunit containing receptors. Since NMDA receptors are known to be permeable to calcium ions upon excitation, the extent of NMDA receptor activation, and its inhibition by functional antagonists can be characterised by measuring the rise in the intracellular calcium concentration following agonist (NMDA) application onto the cells. Since there is very high sequence homology between rat and human NMDA receptors (99, 95, 97% for NR1, NR2A, and NR2B subunits, respectively), it is believed that there is little, if any, difference in their pharmacological sensitivity. Hence, results obtained with (cloned or native) rat NMDA receptors may be well extrapolated to the human ones.

The intracellular calcium measurements are carried out on primary neocortical cell cultures derived from 17 day old Charles River rat embryos [for the details on the preparation of neocortical cell culture see Johnson, M. I.; Bunge, R. P. (1992): Primary cell cultures of peripheral and central neurons and glia. In: Protocols for Neural Cell Culture, eds: Fedoroff, S.; Richardson A., The Humana Press Inc., 13-38.] After isolation, the cells are plated onto standard 96-well microplates and the cultures are maintained in an atmosphere of 95% air-5% CO<sub>2</sub> at 37° C. until testing.

The cultures are used for the intracellular calcium measurements after 4-7 days in vitro. The cells are loaded with a fluorescent Ca<sup>2+</sup>-sensitive dye, Fluo-4/AM (2-2.5 μM) prior to testing. Loading is stopped by washing twice with the solution used also during the measurement (140 mM NaCl, 5 mM KCl, 2 mM CaCl<sub>2</sub>, 5 mM HEPES [4-(2-hydroxyethyl)-1-piperazineethane-sulfonic acid], 5 mM HEPES-Na, 20 mM glucose, 10 μM glycine, pH=7.4). Then the test compound dissolved in the above solution (90 μl/well) is added. Intracellular calcium measurements are carried out with a plate reader fluorimeter. A rise is induced by application of 40 μM NMDA in Fluo-4-fluorescence that reflects the intracellular calcium concentration. Inhibitory potency of the test compound is assessed by measuring the reduction in the calcium elevation in the presence of different concentrations of the compound. After the measurement, a standard calibration procedure [Meth. Cell. Biol., 40, 155-181 (1994)] is applied to convert the fluorescence data to calcium concentration values.

Inhibitory potency of a compound at a single concentration point is expressed as percent inhibition of the control NMDA response. Sigmoidal concentration-inhibition curves are fitted over the data and IC<sub>50</sub> values are defined as the concentration that produces half of the maximal inhibition that could be achieved with the compound. Mean IC<sub>50</sub> values are derived from at least three independent experiments.

#### Determining Binding of Compounds to NR2B Subunit by [<sup>3</sup>H]-Ro 25,6981 Binding Assay

The method for determining the binding of compounds to NR2B subunit by [<sup>3</sup>H]-Ro 25,6981 binding assay is essentially similar to that described by Mutel et al. [J. Neurochem., 70, 2147-2155 (1998)] except for incubation temperature and radioligand concentration. Briefly, membranes are isolated from the forebrain of male Wistar rats. They are incubated in the presence and absence of test compound for 2 hours at room temperature. Non-specific binding is determined using

10

10 μM Ro-25,6981, and is typically less than 7% of the total binding. The applied radioligand (<sup>3</sup>H-Ro-25,6981) concentration is 4 nM. IC<sub>50</sub> values (50% inhibitory concentrations) are determined from sigmoidal fits plotted over concentration-displacement curves.

#### The Biological Activity of the Compounds

IC<sub>50</sub> values for selected examples of compounds of this invention in the functional NMDA antagonism and in the binding tests are listed in Table 1 and compared to those determined for the most potent known reference compounds.

The compounds of this invention exhibit IC<sub>50</sub> values of less than 50 μM in the functional NMDA antagonism and in the binding tests. Thus the compounds and pharmaceutical compositions of this invention are NR2B subtype specific NMDA antagonists. Some of the compounds have superior potency compared to the known reference compounds (see Table 1).

#### Mouse Formalin Test for Measurement of In Vivo Efficacy

Injection of diluted formalin into the hind paw of rats or mouse is known to elicit a biphasic pain related behaviour measured as time spent by licking/biting of the injured paw. The second phase is generally defined as pain related events detected in the 15-60 min. time interval after formalin injection.

tion. It is known that NMDA receptors are involved in the second phase of response to formalin injection and this behavioural response is sensitive to blockade of NMDA receptors [Dickenson, A. and Besson J.-M. (Eds.): Chapter 1, pp. 6-7: Animal models of Analgesia; and Chapter 8, pp. 180-183: Mechanism of Central Hypersensitivity: Excitatory Amino Acid Mechanisms and Their Control—In Pharmacology of Pain. Springer-Verlag (Berlin) 1997.] Therefore, we performed the second phase of formalin test to characterise the efficacy of compounds in vivo. Inhibition of the second phase of response is considered to indicate an analgesic effect against chemically-induced persistent pain [Hunskar, S., et al.: Formalin Test in Mice, a Useful Technique for Evaluating Mild Analgesics, Journal of Neuroscience Methods, 14 (1985) 69-76.] Male albino Charles River NMRI mice (20-25 g) were used. Prior to the experiment any solid food was withdrawn for 16 hours but the animals had free access to 20% glucose solution. The animals were allowed a 1 hour acclimatisation period spent in a glass cylinder (cc. 15 cm in diameter), then moved to an identical cylinder with a mirror placed behind to facilitate observation. The test substances were suspended in 5% tween-80 (10 ml per kg body weight) and administered orally by gavage 15 min before the formalin injection (20 µl of 1% formalin in 0.9% saline injected subcutaneously into the dorsal surface of the right hindpaw). The time spent by licking and biting of the injected paw was measured from 20 to 25 min. after the formalin injection. For the determination of ED<sub>50</sub> value, various doses (at least five) of the test substances were given to groups of 5 mice and the results expressed as % inhibition time spent by licking relative to a vehicle control group observed on the same day. ED<sub>50</sub> values (i.e., the dose yielding 50% inhibition) were calculated by Boltzman's sigmoidal curve fitting.

Disorders which may be beneficially treated with NMDA antagonists include traumatic injury of brain [Neurol. Res., 21, 330-338 (1999)] or spinal cord [Eur. J. Pharmacol., 175, 165-74 (1990)], human immunodeficiency virus (HIV) related neuronal injury [Annu. Rev. Pharmacol. Toxicol., 1998; 38:159-77], amyotrophic lateral sclerosis [Neurol. Res., 21, 309-12 (1999)], tolerance and/or dependence to opioid treatment of pain [Brain. Res., 731, 171-181 (1996)], withdrawal syndromes of e.g., alcohol, opioids or cocaine [Drug and Alcohol Depend., 59, 1-15 (2000)], muscular spasm [Neurosci. Lett., 73, 143-148 (1987)], dementia of various origins [Expert Opin. Investig. Drugs, 9, 1397-406 (2000)]. An NMDA antagonist may also be useful to treat cerebral ischemia of any origin (e.g., stroke, heart surgery), chronic neurodegenerative disorders, such as Alzheimer's disease,

12

Parkinson's disease, Huntington's disease, pain (e.g., post-traumatic or postoperative) and chronic pain states, such as neuropathic pain or cancer related pain, epilepsy, anxiety, depression, migraine, psychosis, hypoglycemia, degenerative disorders of the retina (e.g., CMV retinitis), glaucoma, asthma, tinnitus, aminoglycoside antibiotic-induced hearing loss [Drug News Perspect 11, 523-569 (1998) and WO 00/00197 international patent application].

Accordingly, effective amounts of the compounds of the invention may be beneficially used for the treatment of traumatic injury of brain or spinal cord, human immunodeficiency virus (HIV) related neuronal injury, amyotrophic lateral sclerosis, tolerance and/or dependence to opioid treatment of pain, withdrawal syndromes of e.g., alcohol, opioids or cocaine, ischemic CNS disorders, chronic neurodegenerative disorders, such as Alzheimer's disease, Parkinson's disease, Huntington's disease, pain and chronic pain states, such as neuropathic pain or cancer related pain, epilepsy, anxiety, depression, migraine, psychosis, muscular spasm, dementia of various origin, hypoglycemia, degenerative disorders of the retina, glaucoma, asthma, tinnitus, aminoglycoside antibiotic-induced hearing loss.

The compounds of the invention as well as their pharmaceutically acceptable salts can be used as such or suitably in the form of pharmaceutical compositions. These compositions (drugs) can be in solid, liquid or semiliquid form and pharmaceutical adjuvant and auxiliary materials can be added, which are commonly used in practice, such as carriers, excipients, diluents, stabilizers, wetting or emulsifying agents, pH- and osmotic pressure-influencing, flavoring or aromatizing, as well as formulation-promoting or formulation-providing additives.

The dosage required to exert the therapeutical effect can vary within wide limits and will be fitted to the individual requirements in each of the particular cases, depending on the stage of the disease, the condition and the bodyweight of the patient to be treated, as well as the sensitivity of the patient against the active ingredient, route of administration and number of daily treatments. The actual dose of the active ingredient to be used can safely be determined by the attending physician skilled in the art in the knowledge of the patient to be treated.

The pharmaceutical compositions containing the active ingredient according to the present invention usually contain 0.01 to 100 mg of active ingredient in a single dosage unit. It is, of course possible that the amount of the active ingredient in some compositions exceeds the upper or lower limits defined above.

The solid forms of the pharmaceutical compositions can be for example tablets, dragées, capsules, pills or lyophilized powder ampoules useful for the preparation of injections. Liquid compositions are the injectable and infusible compositions, fluid medicines, packing fluids and drops. Semiliquid compositions can be ointments, balsams, creams, shaking mixtures and suppositories.

For the sake of a simple administration it is suitable if the pharmaceutical compositions comprise dosage units containing the amount of the active ingredient to be administered once, or a few multiples or a half, third or fourth part thereof. Such dosage units are e.g., tablets, which can be powdered with grooves promoting the halving or quartering of the tablet in order to exactly administer the required amount of the active ingredient.

Tablets can be coated with an acid-soluble layer in order to assure the release of the active ingredient content after leaving the stomach. Such tablets are enteric-coated. A similar effect can be achieved also by encapsulating the active ingredient.

13

The pharmaceutical compositions for oral administration can contain, for example, lactose or starch as excipients, sodium carboxymethylcellulose, methylcellulose, polyvinyl pyrrolidone or starch paste as binders or granulating agents. Potato starch or microcrystalline cellulose is added as disintegration agents, but ultraamylpectin or formaldehyde casein can also be used. Talcum, colloidal silicic acid, stearin, calcium or magnesium stearate can be used as antiadhesive and lubricants.

The tablet can be manufactured for example by wet granulation, followed by pressing. The mixed active ingredients and excipients, as well as in given case part of the disintegrants are granulated with an aqueous, alcoholic or aqueous alcoholic solution of the binders in an appropriate equipment, then the granulate is dried. The other disintegrants, lubricants and antiadhesive agents are added to the dried granulate, and the mixture is pressed to a tablet. In given case the tablets are made with halving groove to ease the administration.

The tablets can be made directly from the mixture of the active ingredient and the proper auxiliaries by pressing. In given case, the tablets can be coated by using additives commonly used in the pharmaceutical practice, for example stabilizers, flavoring, coloring agents, such as sugar, cellulose derivatives (e.g., methyl- or ethylcellulose, sodium carboxymethylcellulose, etc), polyvinyl pyrrolidone, calcium phosphate, calcium carbonate, food coloring agents, food laces, aroma agents, iron oxide pigments, etc. In the case of capsules the mixture of the active ingredient and the auxiliaries is filled into capsules.

Liquid oral compositions, for example suspensions, syrups, elixirs can be made by using water, glycols, oils, alcohols, coloring and flavoring agents.

For rectal administration the composition is formulated in suppositories or clysters. The suppository can contain beside the active ingredient a carrier, so called adeps pro suppository. Carriers can be vegetable oils, such as hydrogenated vegetable oils, triglycerides of C12-C18 fatty acids (preferably the carriers under the trade name Witepsol). The active ingredient is homogeneously mixed with the melted adeps pro suppository and the suppositories are moulded.

For parenteral administration the composition is formulated as injection solution. For manufacturing the injection solution the active ingredients are dissolved in distilled water and/or in different organic solvents, such as glycolethers, in given case in the presence of solubilizers, for example polioxyethylensorbitane-monolaurate, -monooleate, or monostearate (Tween 20, Tween 60, Tween 80). The injection solution can also contain different auxiliaries, such as conserving agents, for example ethylenediamine tetraacetate, as well as pH adjusting agents and buffers and in given case local anaesthetic, e.g., lidocain. The injection solution containing the active ingredient of the invention is filtered before it is filled into ampoules, and it is sterilized after filling.

If the active ingredient is hygroscopic, then it can be stabilized by lyophilization.

The following examples illustrate the invention without intending to limit the scope of the invention.

## EXAMPLE 1

2-[4-(4-Fluoro-benzyl)-piperidin-1-yl]-2-oxo-N-(2-oxo-2,3-dihydro-1H-indol-5-yl)-acetamide (45 70001598)

1a) [4-(4-Fluoro-benzyl)-piperidin-1-yl]-oxo-acetic acid ethyl ester

To a stirred solution of 2.3 g (10 mmol) of 4-(4-fluoro-benzyl)-piperidine hydrochloride [J. Med. Chem., 35, 4903. (1992)] and 4.5 ml (32 mmol) of triethylamine in 80 ml of chloroform 2.5 ml (22 mmol) of ethyl oxalyl chloride in 20 ml

of chloroform is added dropwise below 10° C., and the reaction mixture is stirred at room temperature for 10 hours. Then 50 ml of 8% sodium hydrogen carbonate solution is added to the mixture, the organic layer is separated and the water phase is extracted three times with 25 ml of chloroform. The combined organic layers are dried over sodium sulfate, concentrated, the residue is treated with diisopropyl ether and the crystals are filtered to yield 2.1 g (72%) of the title compound. Melting Point: 72-74° C. (diisopropyl ether)

1b) [4-(4-Fluoro-benzyl)-piperidin-1-yl]-oxo-acetic acid

To a stirred solution of 1.91 g (6.5 mmol) of [(4-fluoro-benzyl)-piperidin-1-yl]-oxo-acetic acid ethyl ester in 15 ml of ethanol is added a solution of 1.18 g (21.1 mmol) of potassium hydroxide in 3 ml of water. The reaction mixture is stirred at room temperature for 6 hours then cooled and acidified with hydrochloric acid. The solid is collected, washed with water to yield 1.68. (97.4%) g of the title compound. Melting Point: 152-154° C. (ethanol-water)

1c) 2-[4-(4-Fluoro-benzyl)-piperidin-1-yl]-2-oxo-N-(2-oxo-2,3-dihydro-1H-indol-5-yl)-acetamide

A mixture of 3.2 g (12 mmol) of [4-(4-fluoro-benzyl)-piperidin-1-yl]-oxo-acetic acid, 1.4 ml (10 mmol) of triethylamine, 1.5 g (10 mmol) of 5-amino-1,3-dihydro-indol-2-one [Tetrahedron, 24, 1376. (1957)] 3.8 g (10 mmol) of HBTU [O-benzotriazol-1-yl-N,N,N',N'-tetramethyluronium hexafluorophosphate (Advanced Chem. Tech.)] and 100 ml of dimethylformamide is stirred at room temperature for 24 hours. The reaction mixture is concentrated. Then 150 ml of 8% sodium hydrogencarbonate solution and 150 ml of chloroform is added to the mixture. The organic layer is separated and the water phase is extracted three times with 25 ml of chloroform. The combined organic layers are dried over sodium sulfate, concentrated and the residue is purified by column chromatography using Kieselgel 60 as adsorbent (Merck) and chloroform:methanol=19:1 as eluent to yield 2.67 g (68%) of the title compound. Melting Point: 195-197° C. (diethylether)

## EXAMPLE 2

2-[4-(4-Fluoro-benzyl)-piperidin-1-yl]-2-oxo-N-(2-oxo-2,3-dihydro-1H-benzimidazol-5-yl)-acetamide (45 70001623)

A mixture of 2.5 g (9.6 mmol) of [4-(4-fluoro-benzyl)-piperidin-1-yl]-oxo-acetic acid (Example 1b), 1.1 ml (8 mmol) of triethylamine, 1.2 g (8 mmol) of 5-amino-1,3-dihydro-benzimidazol-2-one [J. Amer. Chem. Soc., 80, 1657. (1958)] 3.03 g (8 mmol) of HBTU and 80 ml of dimethylformamide is stirred at room temperature for 24 hours. The reaction mixture is concentrated, then 100 ml of 8% sodium hydrogencarbonate solution is added. The precipitated product is filtered off and recrystallized from methanol to yield 1.51 g (48%) of the title compound. Melting Point: >260° C. (methanol)

2-[4-(4-Chloro-phenoxy)-piperidin-1-yl]-2-oxo-N-(2-oxo-2,3-dihydro-1H-indol-5-yl)-acetamide (45 70002367)

29a) 4-(4-Chloro-phenoxy)-piperidin-1-carboxylic acid tert-butyl ester

Under argon, to a stirred solution 10.0 g (49.7 mmol) of 4-hydroxy-piperidin-1-carboxylic acid tert-butyl ester [Bioorg. Med. Chem. Lett. 10, 2815. (2000)] in 80 ml of dimethylformamide 3.0 g (60%, 75 mmol) of sodium hydride is added. The reaction mixture is stirred for 1 hour at 40° C., then 5.3 ml (49.7 mmol) of 1-chloro-4-fluoro-benzene (Aldrich) in 20 ml dimethylformamide is added dropwise at 20° C. The reaction mixture is stirred for 4 hours at 80° C., cooled to 20° C., 1 ml of ethanol is added dropwise, poured into 100 ml of water and extracted with ethyl acetate. The organic layer is dried over sodium sulfate and concentrated. The residue is purified by column chromatography using Kieselgel 60 (Merck) as adsorbent and ethyl acetate as eluent to yield 11.07 g (75.5%) of the title compound. Melting Point: oil

29b) 4-(4-Chloro-phenoxy)-piperidine hydrochloride

To a solution of 150 ml of 2.5 M hydrochloric acid in ethyl acetate 11.07 g (37.5 mmol) of 4-(4-chloro-phenoxy)-piperidin-1-carboxylic acid tert-butyl ester is added. The reaction mixture is stirred for 3 hours at 20° C., then concentrated to 50 ml. The precipitated crystals are filtered off, washed with ethyl acetate to yield 7.0 g (75.2%) of the title compound. Melting Point: 194-196° C.

29c) [4-(4-Chloro-phenoxy)-piperidin-1-yl]-oxo-acetic acid ethyl ester

The title compound is prepared from 4-(4-chloro-phenoxy)-piperidine and ethyl oxalyl chloride according to the method described in Example 1a. Melting Point: oil.

29d) [4-(4-Chloro-phenoxy)-piperidin-1-yl]-oxo-acetic acid

The title compound is prepared from [4-(4-fluoro-phenoxy)-piperidin-1-yl]-oxo-acetic acid ethyl ester according to the method described in Example 1b. Melting Point: 144-145° C. (ethanol-water)

29e) 2-[4-(4-Chloro-phenoxy)-piperidin-1-yl]-2-oxo-N-(2-oxo-2,3-dihydro-1H-indol-5-yl)-acetamide

38b) 5-Amino-2,3-dihydro-indol-1-carboxylic acid tert-butyl ester

A mixture of 15.3 g (60.7 mmol) of 5-nitro-2,3-dihydro-indol-1-carboxylic acid tert-butyl ester, 200 ml of methanol, 200 ml of tetrahydrofuran and 1 g of 10% Pd/C catalyst is hydrogenated. After completion of the reaction, the catalyst is filtered off, washed with tetrahydrofuran and the filtrate is concentrated. The residue is treated with a mixture of diisopropyl ether and hexane and the precipitated crystals are filtered off to yield 12.2 g (90.5%) of the title compound. Melting Point: 75-76° C. (isopropyl ether-hexane)

38c) (4-benzyl-piperidin-1-yl)-oxo-acetyl chloride

A mixture of 28.78 g (116.3 mmol) of (4-benzyl-piperidin-1-yl)-oxo-acetic acid (Example 5b) and 50 ml of thionyl chloride is refluxed for 2 hours. The reaction mixture is concentrated to yield 30.5 g (98.6%) of the title compound as a solid. The crude product is used in the next step.

38d) 5-[2-(4-Benzyl-piperidin-1-yl)-2-oxo-acetylamino]-2,3-dihydro-indol-1-carboxylic acid tert-butyl ester

To a stirred solution of 0.5 g (2.25 mmol) of 5-amino-2,3-dihydro-indol-1-carboxylic acid tert-butyl ester and 0.4 ml (2.8 mmol) of triethylamine in 20 ml of chloroform 0.7 g (2.6 mmol) of (4-benzyl-piperidin-1-yl)-oxo-acetyl chloride in 10 ml of chloroform is added dropwise at 0° C. The reaction mixture is stirred at room temperature for 1 hour, then washed with water and the organic layer is concentrated. The residue is purified by column chromatography using Kieselgel 60 (Merck) as adsorbent and toluene:methanol=4:1 as eluent to yield 0.9 g (88.7%) of the title compound as solid. The crude product is used in the next step.

38e) 2-(4-Benzyl-piperidin-1-yl)-N-(2,3-dihydro-1H-indol-5-yl)-2-oxo-acetamide

To a solution of 10 ml of 2.5 M hydrochloric acid in ethyl acetate 0.9 g (2.0 mmol) of 5-[2-(4-benzyl-piperidin-1-yl)-2-oxo-acetylamino]-2,3-dihydro-indol-1-carboxylic acid tert-butyl ester is added. The reaction mixture is stirred for 3 hours at 20° C., then concentrated. The product is transformed into base form with 2 M sodium carbonate solution, extracted with chloroform, the organic layer is concentrated and the residue is dried to yield 0.45 g (64.1%) of the title compound. Melting Point: 152° C.

N-methyl-morpholine in 8 ml of dimethylformamid 0.2 ml (1.5 mmol) of isobutyl-chloroformate is added dropwise at 0° C. and the mixture is stirred at 0° C. for 1 hour. Then 0.333 g (1.4 mmol) of 4-piperidin-4-ylmethyl-benzonitrile hydrochloride and 0.165 ml (1.5 mmol) of N-methyl-morpholine are added and the reaction mixture is stirred at 0° C. for 1 hour, at room temperature for 16 hours. The reaction mixture is concentrated and the residue is purified by column chromatography using Kieselgel 60 (Merck) as adsorbent and toluene:methanol=4:1 as eluent to yield 0.045 g (8.0%) of the title compound. Rf.: 0.4. Melting Point: 259-260° C. (isopropanol).

The reaction mixture is concentrated. Then 150 ml of water and 150 ml of chloroform are added to the mixture. The organic layer is separated and the water phase is extracted three times with 50 ml of chloroform. The combined organic layers are washed 100 ml of water dried over sodium sulfate. Concentrated and the residue is treated with 2.5 N hydrochloric acid in ethyl acetate to yield the title compound. The crude product is used in the next step.

247b) [4-(4-Fluoro-benzyl)-piperidin-1-yl]acetic acid hydrochloride

The title compound is prepared from [4-(4-fluoro-benzyl)-piperidin-1-yl]-acetic acid ethyl ester hydrochloride according to the method described in Example 1b. The crude product is used in the next step.

247c) 2-[4-(4-Fluoro-benzyl)-piperidin-1-yl]-N-(2-thioxo-2,3-dihydro-1H-benzimidazol-5-yl)-acetamide

The title compound is prepared from [4-(4-fluoro-benzyl)-piperidin-1-yl]-acetic acid hydrochloride and 6-amino-1H-benzimidazol-2-thiol according to the method described in Example 1c. Melting Point: 266-268° C. (diethylether)

## EXAMPLE 248

## Procedure "A"

For producing compound of formula (I), where X are —CO— group and R<sup>1</sup>, R<sup>2</sup>, Y, Z, U, V, n and m are as defined for the formula (I).

Step (1): Preparation of the ester compounds of formula (VIII)

where R<sup>1</sup>, R<sup>2</sup>, m, n, Y and Z have the same meaning as given for formula (I). 0.1 mmol of a secondary amines of formula (III)—where R<sup>1</sup>, R<sup>2</sup>, m, n, Y and Z have the same meaning as given for formula (I)—are solved in 0.4 ml of CH<sub>2</sub>Cl<sub>2</sub>. Solid-supported base 2.5 (diisopropylaminomethyl)polystyrene, 3 mmol/g, Fluka, cat.nr.: 38343 (83 mg) and 11.2 μL of ethyl oxalylchloride are added to the solution. The mixture is vigorously shaken for 2 hours at 40° C. The slurry is filtered off, and the resin is washed 3 times with CH<sub>2</sub>Cl<sub>2</sub>. The filtrate is concentrated in vacuum. (yield: ~100%)

68

Step (2): Hydrolysis of the above ester compounds to oxalic acid monoamides of formula (IX)

where R<sup>1</sup>, R<sup>2</sup>, m, n, Y and Z have the same meaning as given for formula (I).

The above obtained ester compounds of formula (VIII) are solved in 0.8 ml of ethanol and 120 mg of strongly basic ion exchange resin (DOWEX-2X8-100) in OH<sup>-</sup> form is added. The mixture is vigorously shaken for 16 hours at 60° C., then the solvent is filtered off. The resin is washed 3 times with ethanol. The resin then suspended in 0.8 ml of ethyl acetate, 0.8 ml of 1.5 M HCl/ethyl acetate is added and the mixture is vigorously shaken for 3 hours at room temperature. The resin is filtered off, washed with ethyl acetate and the filtrate is concentrated in vacuum. (yield: ~100%)

Step (3): Coupling—The above obtained oxalic acid monoamides of formula (IX) are solved in 2 ml of CH<sub>2</sub>Cl<sub>2</sub>/DMF 1:1. 0.125 mmol of amine of formula (V)—where V and U areas given for formula (I)—and 0.25 mmol of 1-[3-(dimethylamino)-propyl]-3-ethylcarbodiimide (EDC) are added and the mixture is vigorously shaken for 12 hours. The mixture is diluted with 2 ml of CH<sub>2</sub>Cl<sub>2</sub>, and extracted with 4 mL of water three times. Solid supported 4-benzyloxybenzaldehyde (200 mg, 3 mmol/g, Novabiochem, Cat.nr.: 01-64-0182) is added to the organic solution and the mixture is vigorously shaken for 2 hours at 40° C. The resin is filtered off and the filtrate is concentrated to yield as final product the compounds of formula (I)—where X are —CO— group and R<sup>1</sup>, R<sup>2</sup>, Y, Z, U, V, n and m are as defined above.

## EXAMPLE 249

## Procedure "B"

For producing compound of formula (I)—where X is —CH<sub>2</sub>— group and R<sup>1</sup>, R<sup>2</sup>, Y, Z, U, V, n and m are as defined above.

Step (1): Preparation of the ester compounds of formula (X)

where R<sup>1</sup>, R<sup>2</sup>, m, n, Y and Z have the same meaning as given for formula (I).

0.1 mmol of a secondary amines of formula (III)—where R<sup>1</sup>, R<sup>2</sup>, m, n, Y and Z have the same meaning as given for formula (I)—and 0.04 g (0.28 mmol) of K<sub>2</sub>CO<sub>3</sub> are solved in 0.8 ml of DMF. 12 μL (0.128 mmol) of methyl bromoacetate is added and the mixture is vigorously shaken for 3 hours. 1.6 ml of diethyl ether is added to the mixture, and the precipitated salts are filtered off. The filtrate is concentrated in vacuum. (yield: ~100%)

## US 7,435,744 B2

69

Step (2): Hydrolysis of the above ester compounds to substituted glycines of formula (XI)

where  $R^1$ ,  $R^2$ ,  $m$ ,  $n$ ,  $Y$  and  $Z$  have the same meaning as given for formula (I).

The above obtained ester compounds of formula (X) is solved in 0.8 ml of ethanol and 120 mg of strongly basic ion exchange resin (DOWEX-2X8-100) in  $OH^-$  form is added. The mixture is vigorously shaken for 16 hours at  $60^\circ C$ , then the solvent is filtered off, washed with ethyl acetate, and the filtrate is concentrated in vacuum. (yield: ~100%)

Step (3): Coupling—The above obtained substituted glycines of formula (XI) is solved in 2 ml of  $CH_2Cl_2/DMF$  1:1. 0.125 mmol of amine of formula (V)—where  $V$  and  $U$  areas given for formula (I)—and 0.25 mmol of EDC are added and the mixture is vigorously shaken for 12 hours. The mixture is diluted with 2 ml of  $CH_2Cl_2$ , and extracted with 4 ml of water three times. Solid-supported 4-benzyloxybenzaldehyde (200 mg, 3 mmol/g) is added to the organic solution, and the mixture is vigorously shaken for 2 hours at  $40^\circ C$ . The resin is filtered off and the filtrate is concentrated to yield as final product the compounds of formula (I)—where  $X$  is  $-CH_2-$  group and  $R^1$ ,  $R^2$ ,  $Y$ ,  $Z$ ,  $U$ ,  $V$ ,  $n$  and  $m$  are as defined above.

## EXAMPLE 250

## Characterization and Purification Methods

Compounds of the present invention were characterized by high performance liquid chromatography coupled to mass selective detector (LC/MS) using HP 1100 Binary Gradient chromatography system with Microplate Sampler (Agilent, Waldbronn), controlled by ChemStation software. HP diode array detector was used to acquire UV spectra at 225 and 240

70

nm. All experiments were performed using HP MSD (Agilent, Waldbronn) single quadrupole spectrometer equipped with an electrospray ionisation source to determine the structure.

(XI) 5 The synthesized products were dissolved in 1 ml DMSO (Aldrich, Germany). 100  $\mu l$  of each solution was diluted with DMSO to 1000  $\mu l$  volume. Analytical chromatographic experiments were performed on Discovery RP C-16 Amide, 5 cm $\times$ 4.6 mm $\times$ 5  $\mu m$  column from Supelco (Bellefonte, Pa.) 10 with a flow rate of 1 ml/minute for qualification. The obtained compounds were characterized by their  $k'$  value (purity, capacity factor).  $k'$  factors are evaluated by the following formula:

$$k' = (t_R - t_0) / t_0$$

$k'$ =capacity factor,  $t_R$ =retention time and  $t_0$ =eluent retention time.

The A eluent was water containing 0.1% trifluoroacetic acid (TFA) (Sigma, Germany), the B eluent was 95% acetonitrile (Merck, Germany) containing 0.1% TFA and 5% A eluent. Gradient elution was used, starting with 100% A eluent and processing to 100% B eluent over a period of 5 minutes.

Semipreparative separation of the compounds of the present invention—purity below 85%—was carried out using the same high performance chromatography system. The separation was performed on Discovery RP C-16 Amide, 20 cm $\times$ 10 mm $\times$ 5  $\mu m$  semipreparative column from Supelco (Bellefonte, Pa.) with a flow rate of 3 ml/minutes. The fraction collection was based on mass selective separation. Gradient elution was used, starting with 80% A eluent and processing to 65% B eluent over a period of 35 minutes for those compounds where the capacity factor was more than 2.5. The gradient elution was changed, starting with 100% A eluent and processing to 55% B eluent in 30 minutes for those compounds where the capacity factor was less than 2.5. The collected fractions were qualified by the above detailed analytical method and the solvent was evaporated by Speed Vac (Savant, USA).

The compounds prepared as described above in procedures "A" and "B" are shown in Tables 3, 4, 5 and 6, respectively.

Compounds of formula (I) prepared by procedure "A" described in Example 248 where  $X$  is  $-CO-$  group, both of  $-(CHR^1)_m-$  and  $-(CHR^2)_n-$  are  $-CH_2-CH_2-$  groups,  $Y$ ,  $Z$ ,  $U$  and  $V$  are as given below:

## EXAMPLE 251

## Preparation of Pharmaceutical Compositions

## a) Tablets:

0.01-50% of active ingredient of formula I, 15-50% of lactose, 15-50% of potato starch, 5-15% of polyvinyl pyrrolidone, 1-5% of talc, 0.01-3% of magnesium stearate, 1-3% of colloid silicon dioxide and 2-7% of ultraamylpectin are mixed, then are granulated by wet granulation and pressed to tablets.

## b) Dragées, Filmcoated Tablets

The tablets made according to the method described above are coated by a layer consisting of entero- or gastro-solvent film, or of sugar and talc. The dragées are polished by a mixture of beeswax and camuba wax.

## c) Capsules

0.01-50% of active ingredient of formula I, 1-5% of sodium lauryl sulfate, 15-50% of starch, 15-50% of lactose, 1-3% of colloid silicon dioxide and 0.01-3% of magnesium stearate are thoroughly mixed, the mixture is passed through a sieve and filled in hard gelatin capsules.

## d) Suspensions

Ingredients: 0.01-15% of active ingredient of formula I, 0.1-2% of sodium hydroxide, 0.1-3% of citric acid, 0.05-0.2% of nipagin (sodium methyl 4-hydroxybenzoate), 0.005-0.02% of nipasol, 0.01-0.5% of carbopol (polyacrylic acid), 0.1-5% of 96% ethanol, 0.1-1% of flavoring agent, 20-70% of sorbitol (70% aqueous solution) and 30-50% of distilled water.

35

To solution of nipagin and citric acid in 20 ml of distilled water, carbopol is added in small portions under vigorous stirring, and the solution is left to stand for 10-12 h. Then the sodium hydroxide in 1 ml of distilled water, the aqueous solution of sorbitol and finally the ethanolic raspberry flavor are added with stirring. To this carrier the active ingredient is added in small portions and suspended with an immersing homogenizer. Finally the suspension is filled up to the desired final volume with distilled water and the suspension syrup is passed through a colloid milling equipment.

## e) Suppositories

For each suppository 0.01-15% of active ingredient of formula I and 1-20% of lactose are thoroughly mixed, then 50-95% of adeps pro suppository (for example Witepsol 4) is melted, cooled to 35° C. and the mixture of active ingredient and lactose is mixed in it with homogenizer. The obtained mixture is mould in cooled forms.

## f) Lyophilized Powder Ampoule Compositions

A 5% solution of mannitol or lactose is made with bidistilled water for injection use, and the solution is filtered so as to have sterile solution. A 0.01-5% solution of the active ingredient of formula I is also made with bidistilled water for injection use, and this solution is filtered so as to have sterile solution. These two solutions are mixed under aseptic conditions, filled in 1 ml portions into ampoules, the content of the ampoules is lyophilized, and the ampoules are sealed under nitrogen. The contents of the ampoules are dissolved in sterile water or 0.9% (physiological) sterile aqueous sodium chloride solution before administration.

It should be understood that the term "comprises/comprising" when used in this specification, is taken to specify the

presence of stated features, integers, steps or components; but does not preclude the presence or addition of one or more other features, integers, steps, components or groups thereof.

While the invention is susceptible to various modifications and alternative forms, specific embodiments thereof have been shown by way of example in the drawings and herein described in detail. It should be understood, however, that it is not intended to limit the invention to the particular forms disclosed, but on the contrary, the intention is to cover all modifications, equivalents, and alternatives falling within the spirit and scope of the invention as defined by the appended claims.

What is claimed is:

1. A compound comprising a structure of formula (I):

wherein:

V and U:

together form a group that contains one or more heteroatoms, and that taken together with one or more:

- (a) hydrogen atoms;
- (b) carbon atoms;
- (c) —CH= groups;
- (d) —CH₂— groups; or
- (e) additional heteroatoms of the same or different type;

or any combination thereof, form a 4-7 membered homocyclic or heterocyclic ring, wherein the heterocyclic ring is selected from the group consisting of morpholine, pyrrole, pyrrolidine, oxo-pyrrolidine, thioxo-pyrrolidine, pyrazole, pyrazolidine, imidazole, oxo-imidazole, thioxo-imidazole, imidazolidine, oxo-imidazolidine, thioxo-imidazolidine, 1,4-oxazine, oxazole, oxazolidine, oxo-oxazolidine, thioxo-oxazolidine or 3-oxo-1,4-oxazine;

MEMORANDUM OPINION

Plaintiffs here take issue with the interpretation that the United States Patent and Trademark Office (PTO) has imposed upon 35 U.S.C. § 154, the statute that prescribes patent terms. Section 154(a)(2) establishes a term of 20 years from the day on which a successful patent application is first filed. Because the clock begins to run on this filing date, and not on the day the patent is actually granted, some of the effective term of a patent is consumed by the time it takes to prosecute the application. To mitigate the damage that bureaucracy can do to inventors, the statute grants extensions of patent terms for certain specified kinds of PTO delay, 35 U.S.C. § 154(b)(1)(A), and, regardless of the reason, whenever the patent prosecution takes more than three years. 35 U.S.C. § 154(b)(1)(B). Recognizing that the protection provided by these separate guarantees might overlap, Congress has forbidden double-counting: "To the extent that periods of delay attributable to grounds

specified in paragraph (1) overlap, the period of any adjustment granted under this subsection shall not exceed the actual number of days the issuance of the patent was delayed." 35 U.S.C.

§ 154(b)(2)(A). Plaintiffs claim that the PTO has misconstrued or misapplied this provision, and that the PTO is denying them a portion of the term Congress has provided for the protection of their intellectual property rights.

#### **Statutory Scheme**

Until 1994, patent terms were 17 years from the date of issuance. See 35 U.S.C. § 154 (1992) ("Every patent shall contain . . . a grant . . . for the term of seventeen years . . . of the right to exclude others from making, using, or selling the invention throughout the United States. . . ."). In 1994, in order to comply with treaty obligations under the General Agreement on Tariffs and Trade (GATT), the statute was amended to provide a 20-year term from the date on which the application is first filed. See Pub. L. No. 103-465, § 532, 108 Stat. 4809, 4984 (1994). In 1999, concerned that extended prosecution delays could deny inventors substantial portions of their effective patent terms under the new regime, Congress enacted the American Inventors Protection Act, a portion of which -- referred to as the Patent Term Guarantee Act of 1999 -- provided for the adjustments that are at issue in this case. Pub. L. No. 106-113, §§ 4401-4402, 113 Stat. 1501, 1501A-557 (1999).

As currently codified, 35 U.S.C. § 154(b) provides three guarantees of patent term, two of which are at issue here. The first is found in subsection (b) (1) (A), the "[g]uarantee of prompt Patent and Trademark Office response." It provides a one-day extension of patent term for every day that issuance of a patent is delayed by a failure of the PTO to comply with various enumerated statutory deadlines: fourteen months for a first office action; four months to respond to a reply; four months to issue a patent after the fee is paid; and the like. See 35 U.S.C. § 154(b) (1) (A) (i)-(iv). Periods of delay that fit under this provision are called "A delays" or "A periods." The second provision is the "[g]uarantee of no more than 3-year application pendency." Under this provision, a one-day term extension is granted for every day greater than three years after the filing date that it takes for the patent to issue, regardless of whether the delay is the fault of the PTO.<sup>1</sup> See 35 U.S.C. § 154(b) (1) (B). The period that begins after the three-year window has closed is referred to as the "B delay" or the "B period". ("C delays," delays resulting from interferences, secrecy orders, and appeals, are similarly treated but were not involved in the patent applications underlying this suit.)

---

<sup>1</sup> Certain reasons for exceeding the three-year pendency period are excluded, see 35 U.S.C. § 154(b) (1) (b) (i)-(iii), as are periods attributable to the applicant's own delay. See 35 U.S.C. § 154(b) (2) (C).

The extensions granted for A, B, and C delays are subject to the following limitation:

**(A) In general.**--To the extent that periods of delay attributable to grounds specified in paragraph (1) overlap, the period of any adjustment granted under this subsection shall not exceed the actual number of days the issuance of the patent was delayed.

35 U.S.C. § 154(b) (2) (A). This provision is manifestly intended to prevent double-counting of periods of delay, but understanding that intent does not answer the question of what is double-counting and what is not. Proper interpretation of this proscription against windfall extensions requires an assessment of what it means for "periods of delay" to "overlap."

The PTO, pursuant to its power under 35 U.S.C. § 154(b) (3) (A) to "prescribe regulations establishing procedures for the application for and determination of patent term adjustments," has issued final rules and an "explanation" of the rules, setting forth its authoritative construction of the double-counting provision. The rules that the PTO has promulgated essentially parrot the statutory text, see 37 C.F.R. § 1.703(f), and so the real interpretive act is found in something the PTO calls its Explanation of 37 CFR 1.703(f) and of the United States Patent and Trademark Office Interpretation of 35 U.S.C. § 154(b) (2) (A), which was published on June 21, 2004, at 69 Fed. Reg. 34238. Here, the PTO "explained" that:

the Office has consistently taken the position that if an application is entitled to an adjustment under the three-year pendency provision of 35 U.S.C. § 154(b)(1)(B), the entire period during which the application was pending before the Office (except for periods excluded under 35 U.S.C. § 154(b)(1)(B)(i)-(iii)), and not just the period beginning three years after the actual filing date of the application, is the relevant period under 35 U.S.C. § 154(b)(1)(B) in determining whether periods of delay "overlap" under 35 U.S.C. 154(b)(2)(A).

69 Fed. Reg. 34238 (2004) (emphasis added). In short, the PTO's view is that any administrative delay under § 154(b)(1)(A) overlaps any 3-year maximum pendency delay under § 154(b)(1)(B): the applicant gets credit for "A delay" or for "B delay," whichever is larger, but never A + B.

In the plaintiffs' submission, this interpretation does not square with the language of the statute. They argue that the "A period" and "B period" overlap only if they occur on the same calendar day or days. Consider this example, proffered by plaintiff: A patent application is filed on 1/1/02. The patent issues on 1/1/08, six years later. In that six-year period are two "A periods," each one year long: (1) the 14-month deadline for first office action is 3/1/03, but the first office action does not occur until 3/1/04, one year late; (2) the 4-month deadline for patent issuance after payment of the issuance fee is

1/1/07, but the patent does not issue until 1/1/08, another year of delay attributable to the PTO. According to plaintiff, the "B period" begins running on 1/1/05, three years after the patent application was filed, and ends three years later, with the issuance of the patent on 1/1/08. In this example, then, the first "A period" does not overlap the "B period," because it occurs in 2003-04, not in 2005-07. The second "A period," which covers 365 of the same days covered by the "B period," does overlap. Thus, in plaintiff's submission, this patent holder is entitled to four years of adjustment (one year of "A period" delay + three years of "B period" delay). But in the PTO's view, since "the entire period during which the application was pending before the office" is considered to be "B period" for purposes of identifying "overlap," the patent holder gets only three years of adjustment.

#### **Chevron Deference**

We must first decide whether the PTO's interpretation is entitled to deference under Chevron v. NRDC, 467 U.S. 837 (1984). No, the plaintiffs argue, because, under the Supreme Court's holdings in Gonzales v. Oregon, 546 U.S. 243 (2006), and United States v. Mead Corp., 533 U.S. 218 (2001), Congress has not "delegated authority to the agency generally to make rules carrying the force of law," and in any case the interpretation at issue here was not promulgated pursuant to any such authority.

See Gonzales, 546 U.S. at 255-56, citing Mead, 533 U.S. at 226-27. Since at least 1996, the Federal Circuit has held that the PTO is not afforded Chevron deference because it does not have the authority to issue substantive rules, only procedural regulations regarding the conduct of proceedings before the agency. See Merck & Co. v. Kessler, 80 F.3d 1543, 1549-50 (Fed. Cir. 1996).

Here, as in Merck, the authority of the PTO is limited to prescribing "regulations establishing procedures for the application for and determination of patent term adjustments under this subsection." 35 U.S.C. § 154(b)(3)(A) (emphasis added). Indeed, a comparison of this rulemaking authority with the authority conferred for a different purpose in the immediately preceding section of the statute makes it clear that the PTO's authority to interpret the overlap provision is quite limited. In 35 U.S.C. § 154(b)(2)(C)(iii) the PTO is given the power to "prescribe regulations establishing the circumstances that constitute a failure of an applicant to engage in reasonable efforts to conclude processing or examination of an application" (emphasis added) -- that is, the power to elaborate on the meaning of a particular statutory term. No such power is granted under § 154(b)(3)(A). Chevron deference does not apply to the interpretation at issue here.

### **Statutory Construction**

Chevron would not save the PTO's interpretation, however, because it cannot be reconciled with the plain text of the statute. If the statutory text is not ambiguous enough to permit the construction that the agency urges, that construction fails at Chevron's "step one," without regard to whether it is a reasonable attempt to reach a result that Congress might have intended. See, e.g., MCI v. AT&T, 512 U.S. 218, 229 (1994) ("[A]n agency's interpretation of a statute is not entitled to deference when it goes beyond the meaning that the statute can bear.").

The operative question under 35 U.S.C. § 154(b)(2)(A) is whether "periods of delay attributable to grounds specified in paragraph (1) overlap." The only way that periods of time can "overlap" is if they occur on the same day. If an "A delay" occurs on one calendar day and a "B delay" occurs on another, they do not overlap, and § 154(b)(2)(A) does not limit the extension to one day. Recognizing this, the PTO defends its interpretation as essentially running the "period of delay" under subsection (B) from the filing date of the patent application, such that a period of "B delay" always overlaps with any periods of "A delay" for the purposes of applying § 154(b)(2)(A).

The problem with the PTO's construction is that it considers the application delayed under § 154(b)(1)(B) during the

period before it has been delayed. That construction cannot be squared with the language of § 154(b)(1)(B), which applies "if the issue of an original patent is delayed due to the failure of the United States Patent and Trademark Office to issue a patent within 3 years." (Emphasis added.) "B delay" begins when the PTO has failed to issue a patent within three years, not before.

The PTO's interpretation appears to be driven by Congress's admonition that any term extension "not exceed the actual number of days the issuance of the patent was delayed," and by the PTO's view that "A delays" during the first three years of an applications' pendency inevitably lead to "B delays" in later years. Thus, as the PTO sees it, if plaintiffs' construction is adopted, one cause of delay will be counted twice: once because the PTO has failed to meet an administrative deadline, and again because that failure has pushed back the entire processing of the application into the "B period." Indeed, in the example set forth above, plaintiffs' calendar-day construction does result in a total effective patent term of 18 years under the (B) guarantee, so that - again from the PTO's viewpoint -- the applicant is not "compensated" for the PTO's administrative delay, he is benefitted by it.

But if subsection (B) had been intended to guarantee a 17-year patent term and no more, it could easily have been written that way. It is true that the legislative context -- as

distinct from the legislative history -- suggests that Congress may have intended to use subsection (B) to guarantee the 17-year term provided before GATT. But it chose to write a "[g]uarantee of no more than 3-year application pendency," 35 U.S.C.

§ 154(b)(1)(B), not merely a guarantee of 17 effective years of patent term, and do so using language separating that guarantee from a different promise of prompt administration in subsection (A). The PTO's efforts to prevent windfall extensions may be reasonable -- they may even be consistent with Congress's intent -- but its interpretation must square with Congress's words. If the outcome commanded by that text is an unintended result, the problem is for Congress to remedy, not the agency.
